

# PROMATIS EXTRACTOR / DATASmart. PLUG-IN MIG.

## Oracle E-Business Suite to Oracle Fusion ERP Cloud

With the aim of boosting their competitiveness, more and more Oracle E-Business Suite (EBS) customers have decided to move to the Oracle Fusion ERP Cloud. The advantages are diverse: scalability, improved security, intuitive user interface and easy-to-navigate dashboards with real-time data.

However, a system change is usually time consuming. In order to guarantee an efficient project execution, a well-thought out data migration concept needs to be created, since it is particularly the transfer of data that provides the foundation for success. Some aspects, such as the structure of the source and target databases, must be taken into account. Moreover, a smooth system operation needs to be ensured. The transfer must be secure and fast, with minimal system downtime and without data loss.

Without a sound strategy, project managers run the risk of creating overly complex data migration processes and thus exceeding the budget. Software tools that fully or partially automate the migration play an increasingly important role in this and help companies achieve a successful transfer.

## Our Solution

The Plug-in MIG is an application-oriented extension to the PROMATIS Extractor product and supports data migration processes in moving from the Oracle EBS into the Oracle Fusion ERP Cloud. With the help of this tool, migration data is extracted in compliance with standardized column formats in the import templates provided by Oracle (keyword: File-Based Data Import), and can be imported directly into the Oracle Fusion Cloud with just a few steps.

The plug-in enables the extraction of the data objects (master and transaction data) available in the EBS modules (e.g. Accounts Receivables, Accounts Payables, General Ledger, Order Management, Fixed Assets). The data is exported in CSV files using different export formats with extensively definable extraction parameters.

The seamless integration into Oracle solutions based on standardized extraction routines, which are continuously adapted to the current structure of Oracle import templates, allows for a successful execution of complex migration projects.

## Your Benefit

With the Plug-in MIG, you get a universally applicable software tool for data extraction within the scope of demanding system change projects, that significantly increases the efficiency of your migration processes. The delivery scope includes preconfigured and standardized extraction routines from the areas of Financials and Supply Chain Management of the Oracle E-Business Suite. In addition, the specific requirements of these application areas are integrated in the standard. The tool can be flexibly extended: included extraction routines can be individually supplemented and new ones added. Productivity gains can not only be achieved through data migration, but also through a targeted provision of real test data in different project phases.

In addition to these functional advantages, PROMATIS contributes its expert knowledge – both in routine processes and for specific requirements, specialists with profound know-how and many years of experience are ready to offer their assistance. The perfect combination of state-of-the-art technologies and complementary services enables you to master your challenges and achieve high productivity gains.
